

Cessio

Capital, backed by proof.

An AI-underwritten receivables market for compute and digital-service invoices, with settlement evidence recorded on BOT Chain.

PROJECT BRIEF

BOT Chain Builder Challenge 2 / Testnet submission

[Live application](#)

The problem

Small compute providers and digital-service teams often wait weeks to be paid for completed work. Investors lack a compact, inspectable way to evaluate delivery evidence, repayment terms, and settlement state before funding an invoice.

The product

Cessio turns a service invoice into a risk-scored receivable. The product combines evidence-aware underwriting, a funding workflow, and a chain-backed lifecycle: assess, issue, fund, repay, and claim.

What the AI does

The underwriting layer evaluates structured invoice metadata and delivery evidence, applies bounded policy rules, and returns a normalized approval or review decision. AI is used for an asset-level business decision, not as a chat-only interface.

Settlement lifecycle

01	02	03	04	05
Assess	Issue	Fund	Repay	Claim

Current state

A live Testnet DApp reads a completed receipt directly through the Cessio backend and exposes verified contract links, wallet connection, and a clear settlement state.

BOT Chain integration

Cessio is deployed on BOT Chain Testnet, chain ID 968, using the BOT RPC and BOTScan explorer. The contracts are source-verified and the lifecycle has been exercised end to end.

Component	Address
CessioReceivables	0x212d99C7fC7C83901e8d6BB0F82d937F9735d248
MockUSDT / cUSDT	0x4D0984B958b4376dE072DC098404c4afA9155C90
Chain	BOT Chain Testnet / 968

Roadmap

Mainnet deployment after BOT Chain support approval; wallet-signature authentication; managed PostgreSQL persistence; open-receivable creation; originator and investor dashboards; and design-partner validation with compute providers.

Why Cessio

Cessio makes an otherwise opaque credit decision legible. Each funding decision is paired with evidence references, policy outputs, and a settlement record that can be independently checked on-chain.
